Attention

A standard single compartment tub will not allow any stimulator signal to work properly.

Please read all information in this pamphlet before beginning treatment with your Twin-Compartment Footbath.

The color of the Twin-Compartment Footbath may be different than in images shown. (Blue Footbath is show in photos for better resolution)

Twin-Compartment Footbath

For use with Electrical Stimulators

General Description
Instructions
and Warranty Information

To use the Twin-Compartment Footbath, you will need the following items:

A. Twin-Compartment Footbath
B. Electrolyte
C. Black non-adhesive pads with attached lead wire

OPTIONAL: You may find that the flip-top squirter lid is more practical for your application. The sprayer top that comes on the bottle can easily replaced by unscrewing it and screwing the squirter lid on in its place if desired.

Using the Twin-Compartment Footbath

Add 1 teaspoon of Electrolyte to each side of the Footbath.

Fill the Footbath with enough warm water to reach your ankles when you place your feet into each side of the Footbath.

Using the non-adhesive pads with the attached lead wire, place one pad into each side of the Footbath. (The pads do not have to be touching your feet.)

The pads will likely move around during the treatment. The pads transfer the signal to the water and the water transfers the signal to your feet.

Whichever method of application you use, (footbath, conductive socks, or self-adhesive pads) if this is your first time using your stimulator, follow the treatment guide found in the operating and treatment instruction guide for your unit. If you have been using the your unit for a while and are switching to this method from conductive socks or the adhesive pads, you can continue to use your unit with the same time and intensity setting you would normally use.

Attach the lead wire to your stimulator. Turn the stimulator on to the appropriate setting (see note above).

Then just sit back and relax while the device goes to work.

When finished your treatment session, thoroughly dry your feet. Rinse and clean the Footbath and the non-adhesive pads to remove any skin debris, oils, and to prevent build-up of minerals.
